COLLEGE & RESEARCH LIBRARIES PRE-PRINT

Abstract

An online survey sent to the community of professional librarians in the U.S. who provide information literacy instruction in academic libraries provided insights into their practices and the challenges they face. Data include current pedagogical methods, client groups of focus, assessment and evaluation, marketing, instructional objectives, incorporating the new Framework for Information Literacy for Higher Education into instruction, the role of technology in instruction, the importance of relationships with faculty and administrators, and a range of common challenges faced by instructional librarians.ⁱ The survey results can help to identify best practices, to improve current practice, to compare practices across different contexts, and to inform pre-professional preparation of librarians who will become providers of instruction.

The instructional role continues to be emphasized in professional librarians' work in academic libraries.ⁱⁱ Even so-called "digital natives" do not enter post-secondary educational contexts with sophisticated information searching or information evaluation.ⁱⁱⁱ Academic librarians, therefore, have significant responsibility to help students to become information literate. This teaching role is complex and challenging, and has shifted over time from a strict focus on teaching students how to find materials in the library, to broader goals, which include teaching transferable skills such as critical thinking and information evaluation. This study reports a recent survey of U.S. professional librarians with instructional responsibilities that was conducted to explore respondents' views, practices, and concerns. The survey provided useful

feedback on current pedagogical methods, client groups of focus, assessment and evaluation, marketing, instructional objectives, incorporating the new Framework for Information Literacy for Higher Education into instruction, the role of technology in instruction, the importance of relationships with faculty and administrators, and a range of common challenges faced by this community.^{iv} This is the first comprehensive national survey of this type in the U.S., although similar surveys have been conducted in other countries.^v

The definition of information literacy used in this study comes from the Association of College and Research Libraries:

Information literacy is the set of integrated abilities encompassing the reflective discovery of information, the understanding of how information is produced and valued, and the use of information in creating new knowledge and participating ethically in communities of learning.^{vi}

We were also interested in the extent to which the Framework for Information Literacy for Higher Education is being utilized by instructional librarians. The Framework operationalizes the ACRL definition of information literacy by focusing on seven threshold concepts and related knowledge practices and dispositions. The threshold concepts that constitute the Framework are:

- Authority Is Constructed and Contextual
- Information Creation as a Process
- Information has Value
- Research as Inquiry
- Scholarship as Conversation
- Searching as Strategic Exploration^{vii}

The survey data are useful to identify best practices, to identify opportunities for improvement to current practice, to compare practices across different contexts, and to inform pre-professional preparation of librarians who will become providers of instruction. Previous evidence suggests room for improvement in the preparation of librarians for this role.^{viii} In addition, the survey results are directly comparable to several previous surveys conducted in Canada, which allow for future comparative analysis.^{ix}

Research Questions

The following questions motivated this study:

1. What are the instructional practices of librarians with responsibility for information literacy instruction in academic libraries in the United States?
2. What are the challenges faced by these librarians in their instructional role?
3. What are some of the opportunities for improvement in information literacy instruction practice?

Methods

Data were collected via an online national survey. The survey asked respondents for demographic data to identify the context in which they worked. These data points include the kind of library they worked in, the size of their undergraduate population, and their job title. The main body of the survey focused on instruction practices, issues surrounding information literacy, and assessment of instruction. Concerning instruction practices, the survey asked: whether respondents focus their instruction on any particular discipline, whether their library offers any formal or informal instruction, whether they articulate written objectives for their instruction, which staff take responsibility for instruction, what proportion of staff time is spent on instruction, what proportion of the student population receives information literacy

instruction, the content and methods of instruction, the client groups of focus, the effect of changes in information technology to instructional methods and content, and current and ideal instructional objectives (and whether these have changed). Issues of information literacy were explored in questions that asked: what constitutes information literacy, who should take responsibility for developing information literacy skills in students, and to what extent is instruction informed by the ACRL Framework.^x The survey also asked questions about the quality of instruction and how it is assessed. This part of the survey collected respondents' opinions on whether instruction is meeting objectives, and asked about methods of assessing student learning, methods of evaluating instruction, financial and non-financial support for instructional work, marketing of instruction, and challenges to instruction. The survey is provided in Appendix 2.

The survey instrument was designed in English using SelectSurvey and was intended to take no more than 20 minutes to complete. General feedback on the survey design and item responses was solicited from two professional librarians with instructional responsibilities at two geographically disparate universities. Their feedback was useful to ensure that the survey reflected current terminology and practice. Participants were recruited from the ILI-L listserv, an American Library Association (ALA) listserv that focuses on information literacy instruction. At the time of the survey, the listserv had approximately 6000 subscribers. These subscribers are typically professional librarians and paraprofessional library workers who have an interest in information literacy. The introduction to the survey specified that professional academic librarians (i.e., those employed in university or college libraries) who had responsibilities for information literacy instruction were the target sample (Appendix 1). Therefore, any librarians or paraprofessionals on the listserv who were employed in other types of libraries (e.g., public

libraries) were not invited to respond. Consent to participate in the survey was implied by completion of the survey. Prior to participant recruitment and data collection, ethics approval for the study was obtained at the universities where the authors are employed.

In spring 2016, the survey invitation was posted to the ILI-L listserv. The survey remained open for six weeks, with reminders sent out after two weeks, after four weeks, and one week prior to closing. SelectSurvey provided basic quantitative analyses of data and responses to open-ended items were analyzed using a qualitative content analysis method.^{xi}

Results

Respondents

The total number of respondents was 622, although the number of respondents per survey question varied. Since the size of the population is unknown, this is not a probability sample. The largest proportion (60%, n=227) of respondents work in universities, while 39% (n=148) work in colleges or technical institutes. The largest proportion (62%, n=237) work in institutions with fewer than 10,000 undergraduate students; 23% (n=88) work in institutions with 10,000 to 20,000 students, and 15% (n=57) work at institutions with more than 20,000 students. This data is summarized in Table 1 below.

Insert Table 1 Here

Forty-nine percent (n=185) of respondents who provided their job title had “information literacy,” “instruction,” or a similar concept as part of their job title. Examples of other job titles submitted include “assistant librarian,” “social sciences librarian,” “head of public services,” and “associate professor.” Only 92 participants indicated that their library focuses on a particular discipline or subject area. The largest proportion (73%, n=67) focus on a wide range of disciplines or a mixture of disciplines, while 16% (n=15) focus on health-related disciplines, and

11% (n=10) focus on humanities/social sciences or liberal arts. Thus, the data indicate that most respondents worked in libraries with general academic collections.

When asked who had primary responsibility for instruction (and allowed to “check all that apply”), the majority of respondents put reference/public service librarians at the top of the list with 63% of all responses (n=266). Full-time instructional librarians were also seen as responsible for instruction, receiving 55% of all responses (n=196), and other librarians were also considered to carry responsibility for instruction by 101 respondents (28%). Staff other than full-time instructional librarians were seen as carrying primary responsibility for instruction by 43 respondents (12% of responses).

Instructional Practices

In terms of time spent on instruction by staff other than full-time instructional staff, the survey differentiated between time spent at the start of academic terms versus the rest of the year.

Respondents estimated that staff spend significant time on instruction at the start of academic term. Of the total respondents, 137 (41%) said staff spend up to 25% of their time on instruction, 123 (37%) said staff spend 26-50% of their time on instruction, 66 (20%) said staff spend 51-75% their time on instruction, and 10 (3%) said staff spend more than 75% of their time on instruction. In contrast, respondents estimated that during the remainder of the academic year non full-time instructional staff continue to spend time on instruction. Among respondents 199 (59%) said staff spend up to 25% of their time on instruction, 107 (32%) said staff spend 26-50% of their time on instruction, and 30 (9%) estimated staff spend 51-75% of their time on instruction. None of the respondents estimated that staff spend more than 75% of their time on instruction during the remainder of the academic year. These data are displayed in Table 2 below.

Insert Table 2 here

Most respondents reported that teaching information literacy is a shared responsibility with teaching faculty, and with the students themselves (Table 3).

Insert Table 3 here

First year students are the focus of 85% (n=292) of respondents, and 81% (n=277) of respondents focus on undergraduates in particular disciplines. Only 24% (n=81) of respondents offer instruction to teaching faculty. The largest proportion of respondents (34%, n=110) estimated that they reach 50-75% of their undergraduates with their instruction; 28% (n=93) reach fewer than 25% of their undergraduates, and 23% (n=76) reach 76-100% of their undergraduates. The vast majority (92%, n=349) offer formal instructional opportunities in their libraries (i.e., scheduled in advance). Participants who work in libraries that do not offer formal instruction provided reasons such as: “partly size of library staff, but mainly a[n]... unconscious belief that information literacy will just happen as part of the regular course work,” and “the culture at this institution hasn't been favorable for including librarians and information literacy skills as part of the curriculum, but we are in the process of negotiating new partnerships and opportunities to develop a program.” Nearly all respondents (99%, n=358) offer informal instruction, but only 52% (n=179) have a written statement of objectives for their instruction. The most widely reported foci for instruction are databases (94%, n=322), search strategies (88%, n=301), library use in general (84%, n=287), and the online catalog (77%, n=264). The data on instruction foci are provided in Table 4 below.

Insert Table 4 here

Respondents primarily use hands-on instruction in a computer lab (87%, n=299) and one-on-one instruction (87%, n=298), lectures/demonstrations in subject classrooms (81%, n=277),

and web-based subject guides (73%, n=252) as their instructional methods. The data on methods of instruction are provided in Table 5 below.

Insert Table 5 here

Respondents noted that technology has affected instructional delivery and content in the past few years; 61% (n=194) believe that IT has affected instructional delivery “quite a bit” or “a great deal.” Fewer believe that IT has affected content: 49% (n=153) report that instructional content has been affected “quite a bit” or “a great deal.” Forty-five percent (n=141) of respondents believe that use of IT has improved students’ interest or participation in instructional opportunities for 45% (n=141) of respondents, while 19% (n=55) disagree. Those who reported positive changes indicated that using IT increases student engagement, connects with tech-savvy students, provides instructors with the ability to immediately support assignments, and helps instructional librarians to provide content that is more active, fun, personal, and relevant to students’ daily lives. One respondent stated that “we have included practical examples that incorporate technology that students are already familiar with and allow them to use it—incorporating their mobile technology as an assessment aid, for instance.” Another wrote “to be honest, our students have indicated that they feel like we are less old-fashioned and less boring this way.” Another respondent stated, “[technology] allows students to independently organize their learning experience in a manner that suits their personal style. It provides a more active experience for students and creates a more student-focused environment.” Another commented, “I think students are aware of how much information technology is impacting their professions/discipline, and so are motivated to engage with it now, as students, as they see it as a key competency and a competitive skill.” However, another respondent warned:

I would say that IT has increased somewhat interest and participation, but I don't think that it is a silver bullet that can cover up a poorly designed or prepared instruction, or a class with little space for active learning. I also don't think that technology has the 'wow factor' it once did and it is more or less an expectation of students.

Most respondents (64%, n=182) also reported that using IT has improved instruction. One commenter noted, “[P]edagogically, I employ constructivist theories to my practice. Because of this, I believe that linking academic skills that I am teaching to non-academic skills or experiences with which students are familiar can help make headway to true learning. The way I can do that is through use of the internet and digital technologies which students employ in their real lives.” Another noted, “[T]o quote the framework, scholarship/research becomes more of a conversation than a lecture.” One wrote, “I think the various technologies allow us to reach students with varied learning styles and varied levels of accessibility.” Another stated, “I think that creatively designing instruction sessions that leverage the technology—allow students to learn and discover things on their own and share that knowledge with others has improved the learning experience for students and librarians.”

Respondents reported that their primary instructional objective is to teach students how to critically evaluate the quality and usefulness of information, followed by teaching general research strategies. When asked to rank their instructional objectives, participants gave the highest ranking to “teach students how to critically evaluate the quality and usefulness of information” (2.36). The second highest ranking was “teach students general research strategies” (2.48). The rank order of instructional objectives was mirrored in participants’ preferred instructional objectives. Some respondents indicated they had additional instructional objectives,

but did not rank these as important. A complete list of items and rankings is presented in Table 6 below.

Insert Table 6 here

Responses to other survey items reveal that slightly fewer than half (49%, n=121) believe that they are meeting their current instructional objectives, 29% (n=71) do not believe they are meeting these objectives, and 23% (n=57) do not know. Student learning is assessed primarily through faculty feedback (58%, n=152), formative assessment during in-class sessions (41%, n=107), and student self-assessment (40%, n=104).

Evaluation of the library's instructional program is equally informal: 59% (n=154) do so through informal faculty feedback, 53% (n=139) do so through informal student feedback, and 44% (n=115) via self-assessment by the librarians themselves. Fourteen percent (n=35) reported that they do no evaluation. Publicity is also relatively informal: 89% (n=234) use personal faculty contact, 71% (n=187) use notices or letters to faculty, and 54% (n=143) publicize instruction at departmental meetings.

Respondents also noted that their instruction is only partly informed by the new Framework for Information Literacy for Higher Education.^{xii} The largest proportion of respondents (41%, n=103) report that the Framework has had no influence or only a minor influence on their practice, while 31% (n=78) indicated that it has had a significant influence. Most respondents feel fully or partly supported by their library administrations for their instructional work (79%, n=194), but only 6% (n=16) have budgeted funds for instruction.

Challenges

A wide range of challenges to instruction were reported, but a few significant themes emerged. Some of the challenges identified in the open-ended responses are connected with lack of time and lack of adequate staffing:

- *Time - 1) to get into the classes, 2) to prep the classes, 3) scheduling all the instruction sessions, frequently they happen in a small period of time, making a couple of weeks really crazy.*
- *A staff that is stretched thinly already and is covering more than one position. Lack of time for planning and strategizing.*
- *Balancing instruction with other job duties, lack of formal training (no instruction courses or student teaching opportunities provided in MLS program), shortage of available instruction space and technology during peak demand weeks in the year.*
- *Too many students, too few librarians.*
- *The prevalence of the one-shot model of library instruction and the expectation that what we have to teach can be communicated over the course of an hour.*
- *We are at saturation level, presently, and cannot expand our program any more. We focus on instruction for full-sized classes in the English department and for all students on a 1:1 student basis.*

Other challenges relate to lack of student motivation:

- *Students who don't realize they don't have researching skills.*
- *My library focuses only on freshmen and sophomores. We may see some of the same students a few times in any given semester and it's clear that they become bored with library instruction sessions and think each session contains the same content even though - from our perspective - we tailor each instruction session to the course subject and*

research assignment. I want to make our instruction sessions more engaging with a greater focus on the information literacy Framework concepts through activities and gamification techniques. I want students to leave with a greater understanding of how information works and develop transferrable skills that they can use beyond the classroom.

- *Student motivation/attention/engagement and same for non-librarian faculty.*

Several other respondents echoed the inconsistency of buy-in from non-librarian faculty:

- *Faculty investment - we have a mandated set of classes that need to provide library instruction, and faculty buy-in varies greatly.*
- *Faculty indifference. Getting the word out to a large contingent of adjunct faculty.*
- *Getting faculty to understand the value of instruction. Because librarians don't have the standing or cultural value that faculty do, librarians give tours not instruction in the faculty view.*
- *Not enough faculty interest in library instruction. No formal assessment program, so no proof that library instruction is helping improve student work.*

Perhaps most vexing is a perceived lack of support from administration:

- *Revolving administration who have bigger issues to deal with.*
- *We have no scaffolding to instruction. I may teach an introductory English class and an upper-division political science class in the same day, and do very similar things. I can't be sure that the upper division students definitely got basic instruction in lower-level classes. I'd rather spend time showing them how to use advanced government information or demographics or data sets, but sometimes they don't know how to search*

a library database. We can do more towards scaffolding, but it requires a bigger institutional push that we currently don't have.

- *Our administration - despite claiming advocacy for library instruction - has no fundamental understanding of information literacy instruction. We are moving toward a performance based model across all disciplines and without a credit library course, we are unable to provide metrics that demonstrate our value (quantitatively).*
- *Little support from the administration and very little support from the curriculum. Our success depends on individual faculty members who see information literacy as an important component of liberal arts education. No support for assessment means that there's no motivation or time for us to evaluate students' skills as a whole to propose any changes.*
- *Lack of administrative support; dean and his minions do not think what we do in library instruction sessions has much value - his focus is on 3D printers and virtual reality games.*

Respondents were given an opportunity to make final open-ended comments, and some are particularly revealing. While some indicated significant problems (one described the situation as a “train-wreck”), others were more optimistic. Here are some examples:

- *There is hope and change is happening. I have a few faculty on my side and a plan for incorporating information fluency more intentionally into the curriculum. Interest is growing and faculty are realizing that we can work together to improve learning outcomes.*
- *I became an Academic Librarian to teach. With the addition of the Framework for Information Literacy, I have fully evolved my library instruction with tremendous*

success. Teaching & Learning Services within my libraries have raised our instructional brand in a significant way.

- *I am lucky to be in an environment where faculty truly see me as a partner, both inside and outside the classroom.*
- *Currently in the process of developing a new information literacy plan and program where research skills are the beginning and reflective of the ACRL Standards. After research skills, the research process is the focus - faculty and librarians collaborate on curriculum and assignments in order to incorporate the ACRL Framework in disciplines. (Wish us luck!)*
- *We are improving in the teaching and assessment of student learning outcomes but have a long way to go. The IL Standards were great as training wheels to get us moving in the right direction towards authentic assessment, but the IL Framework will truly set us free. Re-imagining what we can do with the reference desk will also be a piece of the puzzle as will partnering more closely with the writing center.*

Discussion

Opportunities for Improvement

These data demonstrate significant commitment to information literacy instruction, as well as a host of substantial challenges to success. The data also suggest multiple opportunities for improvement in instructional practice. In particular, fewer than half of respondents articulate written objectives for the instruction. The practice of recording instructional objectives is a key step in assessing instructional outcomes and evaluating instructional effectiveness. Thus, consistent with that finding, the survey also revealed that assessment and evaluation remain largely informal. In the absence of systematic assessment of learning outcomes associated with

information literacy instruction, the return on investment in instructional work is uncertain, and administrators may have difficulty supporting instructional work. In addition, marketing of instructional opportunities remains relatively informal, suggesting an area that might be strengthened. The picture of instructional practices of librarians responsible for information literacy instruction in the United States that emerges from the data is one in which undergraduate students are the main target population and this audience is reached mainly through formal, but also informal, instructional opportunities in libraries. However, only about half of libraries have formal objectives for instruction, which may hamper their ability to fully assess programs or to have the data at hand to demonstrate the impact the library has in ensuring that students reach competency in information literacy. The focus of much instruction is the use of databases, search strategies, general library use, and use of the online catalog. While these topics reflect needed skills, they also represent the mainstay of instructional efforts. While some respondents report including topics such as social media, open access publishing, images and fair use, and citation metrics, most instruction is skills-based and though increasingly integrating information technology, has yet to incorporate the threshold concepts outlined in the Framework for Information Literacy for Higher Education.^{xiii} This may in large part be due to the newness of the Framework, and thus changes in practice may not have had time to be fully implemented. It is exciting to see that the vast majority of respondents see connections between the concepts presented in the Framework and their responsibility to raise the level of information literacy among students.

In assessing student learning and evaluating the effectiveness of instruction, librarians are using a variety of strategies, but the main data sources for these evaluations lean heavily on student self-assessments and faculty feedback to gauge student learning and self-evaluation and

informal feedback from faculty and students when assessing the quality of the instruction program. Among the respondents in this study, assessing the quality of instruction and programs are topics that academic librarians continue to struggle with.

The challenges faced by these librarians are many. The main issues are time and insufficient support. Respondents talk about being spread thin in terms of their ability to cover the number of classes necessary to meet the needs of the student body. Even though they are stretched thin, librarians are frustrated by the view that information literacy can be achieved over the course of a one-hour demonstration and want to see more support and a greater visibility as instructors who have a high level of needed expertise. Recognition and support are needed from administrators and non-librarians, and academic librarians continue to work to educate these stakeholders in the importance of information literacy and the usefulness of instructional partnerships with librarians. Several respondents had stories of success to share.

Comparison with Canadian Data

The survey findings are largely echoed in data from Canadian surveys of information literacy instruction in academic libraries over an extended period of time.^{xiv} While the Canadian surveys were distributed differently (sent directly to institutions rather than to a listserv for response by any academic librarian), the instrument used was identical (with small updates to reflect current terminology, and a shift from paper to online distribution over time), so data are roughly analogous. In addition, it must be noted that the last Canadian survey was conducted five years ago, and some changes in practice may have occurred since that time. There are few significant differences in results between the U.S. and the latest Canadian data, but one difference is a much larger proportion of librarians in the U.S. sample whose primary job responsibility is

information literacy instruction; according to the last Canadian survey, primary responsibility for information literacy instruction is shared across multiple reference librarians. This difference could be due to the passage of time (i.e., there may now be more dedicated instructional librarians in Canada). The survey results regarding informal assessment and evaluation are similar in the Canadian data. However, written statements of teaching objectives were even less common in Canadian academic libraries. Thus, some of the biggest opportunities to improve instruction are evident in both countries. Finally, respondents in the U.S. and Canadian data sets reflect identical issues and concerns, including variable buy-in from students and course instructors, as well as from library administrations.

Implications for Pre-Professional Preparation

Through this survey, the practice community has provided data with significant potential to inform the preparation of librarians for instructional work. First, understanding the basic who, what, and where of instruction can assist pre-professionals to understand the scope of daily practice. Areas where opportunities for improvement to practice exist (e.g., formalizing assessment of student learning and evaluation of instructional programs, developing marketing expertise, and identifying opportunities for pedagogical innovation), can also inform course content decisions made by educators in pre-professional programs. Understanding the ongoing challenges faced by instructional librarians, which appear to be rather enduring, can also open opportunities for discussion and strategic thinking among pre-professional librarians about ways to ameliorate barriers to achieving the full potential of information literacy instruction.^{xv}

Future Research

As has been done with the survey data gathered in Canada, this survey, or a version of it, could be conducted periodically over time to provide longitudinal data. Analyzing trends can help to

demonstrate progress, as well as identify ongoing and persistent challenges which may merit particular focus for amelioration. More in-depth exploration of instructional work through focus groups and interviews, for example, could also enrich these survey data. There are good examples of such studies that could be used as models.^{xvi}

Conclusion

Information literacy instruction is a fundamental professional practice in academic libraries, and academic librarians are primary providers of information literacy instruction generally.

Improvements to that practice are possible only when current practices across the field are understood. Prior to this survey there were no published descriptive data on those instructional practices for the U.S. as a whole, a gap which this study sought to fill. As information literacy is widely understood to provide a critical foundation for success in daily life, the workplace, and in civic engagement, it is important to promote best practices for information literacy instruction.

The data gathered in this study have the potential to be foundational for identifying and promoting those best practices.

Acknowledgements

The authors are grateful to the librarians who helped pretest the survey and those who took the time to share their experiences and insights by responding to the survey.

Teach to critically evaluate the quality and usefulness of information	2.36
Teach students general research strategies	2.48
Teach students how to find information in various sources	2.64
Teach students how to locate materials in the library	4.10
Teach students how databases in general are structured	4.38
Teach students how to manage information	5.03
Teach awareness of technological innovations	5.99
Other, please state and include ranking	4.36
Total Respondents	273

COLLEGE & RESEARCH LIBRARIES PRE-PRINT

Appendix 1 - Invitation to Participate in the Survey

Survey of Information Literacy Instruction in U.S. Academic Libraries

Are you an academic librarian with instructional responsibilities? You are invited to participate in an online survey aimed at U.S. academic librarians. The purpose of the survey is to identify information literacy instruction practices in U.S. academic libraries. The research is being done by Dr. Heidi Julien from the University at Buffalo, and Dr. Don Latham and Dr. Melissa Gross from Florida State University.

The survey should take no more than 20 minutes to complete, and is accessible using this link:
[link here].

The survey is voluntary. You have the right to not participate in this study, and you have the right not to respond to any particular question items on the survey. If the survey is completed and submitted, your consent to participate will be assumed. Once your survey responses are submitted, you will not be able to withdraw from the study. The survey does not collect identifying information, so survey respondents are anonymous. The survey data will be handled in compliance with standard ethical principles. The study has been approved by the University at Buffalo Institutional Review Board and the Florida State University Institutional Review Board. The data will be used to write research papers and make conference presentations. As far as is known, there are no particular benefits to you to participate in this study, nor is there any potential harm. The only inconvenience to you is your time. If you participate, your survey responses will be stored in a safe place until the study is completed and the results are disseminated (computer data will be password protected), then they will be deleted.

If you have any questions about this study, now or in the future, please contact:

Dr. Heidi Julien

Department of Library and Information Studies

State University of New York at Buffalo

heidijul@buffalo.edu 716-645-1474

You can also contact the research participant advocate at 716-888-4845 or

researchadvocate@buffalo.edu.

COLLEGE & RESEARCH LIBRARIES PRE-PRINT

Appendix 2

Welcome,

Are you an academic librarian with instructional responsibilities? You are invited to participate in an online survey aimed at U.S. academic librarians with instructional responsibilities. The purpose of the survey is to identify information literacy instruction practices in U.S. academic libraries.

Survey of Information Literacy Instruction Practices in U.S. Academic Libraries

1. Your library is associated with a:

College or technical institute

University

Other, please specify

2. What is the size of the undergraduate student population at your institution?

Fewer than 10,000

10,000 – 20,000

More than 20,000

3. What is your job title?

4. If your library focuses on a particular discipline(s) or subject area(s), please indicate:

5. Does your college or university library offer formal (i.e., scheduled in advance) instructional classes?

Yes

No

6. Please indicate briefly why you think there is no formal instructional program at your library.

7. Do you have a written statement of the objectives of your instructional program?

Yes

No

8. Does your library routinely provide informal instruction (i.e., one-to-one, ad hoc instruction) via subject guides (online and/or paper), online tutorials, point-of-use instruction, etc.?

Yes

No

9. Who is primarily responsible for instruction in your library? (check all that apply)

- Full-time instruction librarian(s)
- Reference/public service librarians
- Other librarians on staff
- Other staff, please specify

10. Please estimate the proportion of staff time spent on instruction at the **start** of academic terms, for those staff involved in instruction (other than full-time instruction staff).

- 0-25%
- 26-50%
- 51-75%
- More than 75%

11. Please estimate the proportion of staff time spent on instruction during the **remainder** of the academic year, for those staff involved in instruction (other than full-time instruction staff).

0-25%

26-50%

51-75%

More than 75%

12. For which of the following do you commonly provide instruction? (Check all that apply)

- Print indexes or abstracts
- Audio-visual materials
- CD-ROM resources
- Government documents
- Library classification system
- Online databases
- Bibliographic management tools
- Scholarly communication (e.g., open access publishing, open education resources)
- Other print reference materials
- Catalog/OPAC
- The Internet/World-Wide-Web
- Library use in general
- Electronic documents
- Search strategies (e.g., Boolean)
- Citation metrics
- Other, please specify

13. Which of the following methods do you use in your instruction? (check all that apply)

- Web tutorials
- Hands-on instruction in computer lab
- Individualized instruction (one-on-one)
- Courseware
- Video recordings (e.g., YouTube videos)
- Self-paced library tours
- Workbook program
- Lectures / demonstrations in subject classes
- Essay assistance (workshops)

- Additions to course notes for distance students
- Group instruction focused on particular courses or subjects [in the library]
- Social media
- Flipped classrooms
- Embedded librarians
- Credit course
- Non-credit course
- Posters
- Group library tours
- Library guides or handbooks, web format
- Library guides or handbooks, paper format
- Pathfinders or subject guides (e.g., LibGuides), web format
- Pathfinders or subject guides, paper format
- Other, please specify

14. On what group(s) does your instructional program focus? (Check all that apply)

- First-year students
- Undergraduates in certain subject disciplines
- Teaching staff (faculty)
- Transfer students
- Adult re-entry students
- Postgraduate students
- General community
- Other, please specify

15. Overall, what proportion of undergraduate students do you estimate that you reach in your instructional program?

- 76-100%
- 50-75%
- Fewer than 50%
- Not able to determine
- Other, please explain

16. How much has information technology changed the way you **deliver** instruction in the last few years?

- Not at all Only slightly Quite a bit A great deal

17. If information technology has changed the way you deliver instruction, can you give an example?

18. How much has information technology affected the **content** of your instruction in the last few years?

- Not at all Only slightly Quite a bit A great deal

19. If information technology has changed the content of your instruction, can you give an example?

20. If information technology has changed either the delivery or content of your instruction, do you think that these changes have increased students' **interest or participation** in instruction?

- Yes
 No
 Don't know

21. Please explain briefly how you think these changes have increased students' interest or participation.

22. If information technology has changed either the delivery or content of your instruction, do you think that these changes have **improved** instruction?

- Yes
- No
- Don't know

23. If yes, please indicate "how" technology has improved instruction.

24. What are the objectives (explicitly written or not) of your current instruction?

Please rank from 1 (most important) to 6 (least important)
Rank the items below, using numeric values starting with 1.

- | | |
|---|----------------------|
| Teach awareness of technological innovations | <input type="text"/> |
| Teach students how databases in general are structured | <input type="text"/> |
| Teach students how to find information in various sources | <input type="text"/> |
| Teach students how to locate materials in the library | <input type="text"/> |
| Teach students how to critically evaluate the quality and usefulness of information | <input type="text"/> |
| Teach students general research strategies | <input type="text"/> |
| Teach students how to manage information | <input type="text"/> |
| Other, please state (include ranking) | <input type="text"/> |

25. Have these priorities changed in the past few years?

- No
- Don't know
- Yes, how?

26. How would you like to see the objectives (written or not) of your instruction **change**?

Please rank from 1 (should be most important) to 6 (should be least important)
Rank the items below, using numeric values starting with 1.

Teach awareness of technological innovations	<input type="text"/>
Teach students how databases in general are structured	<input type="text"/>
Teach students how to find information in various sources	<input type="text"/>
Teach students how to locate materials in the library	<input type="text"/>
Teach students how to critically evaluate the quality and usefulness of information	<input type="text"/>
Teach students general research strategies	<input type="text"/>
Teach students how to manage information	<input type="text"/>
Other, please state (with rank)	<input type="text"/>

27. Which of the following would you include in your definition of "information literacy"? (Check all that apply)

- Recognizing when information is needed
- Understanding how information is generated, organized, stored, and transmitted
- Understanding some ethical, legal, economic and socio-political information issues
- Understanding that there exists a wide variety of information sources beyond the obvious
- Understanding how to locate efficiently and effectively information from many sources
- Understanding how to use efficiently and effectively information from many sources
- Understanding how to critically analyze and evaluate information
- Knowing how to think critically in general
- Other, please specify

28. For questions 28-36 please answer for the following question(s): What should be the degree of responsibility of academic librarians in teaching the following? If the responsibility is shared, please explain who else is responsible.

Recognizing when information is needed:

- Not responsible
- Partially responsible
- Fully responsible

Who else should be responsible?

29. Understanding how information is generated, organized, stored, and transmitted:

Not responsible
 Partially responsible
 Fully responsible
 Who else should be responsible?

30. Understanding some ethical, legal, economic and socio-political information issues:

Not responsible
 Partially responsible
 Fully responsible
 Who else should be responsible?

31. Understanding that there exists a wide variety of information sources beyond the obvious:

Not responsible
 Partially responsible
 Fully responsible
 Who else should be responsible?

32. Understanding how to locate efficiently and effectively information from many sources:

Not responsible
 Partially responsible
 Fully responsible
 Who else should be responsible?

33. Understanding how to use efficiently and effectively information from many sources:

Not responsible

- Partially responsible
- Fully responsible
- Who else should be responsible?

34. Understanding how to critically analyze and evaluate information:

- Not responsible
- Partially responsible
- Fully responsible
- Who else should be responsible?

35. Knowing how to think critically in general:

- Not responsible
- Partially responsible
- Fully responsible
- Who else should be responsible?

36. Other?

- Not responsible
- Partially responsible
- Fully responsible
- Who else should be responsible?

37. To what extent is your instruction informed by the new ACRL Framework for Information Literacy for Higher Education?

- The Framework does not inform my instruction at all
- The Framework has had minor influence on my instruction
- The Framework has had a significant influence on my instruction

Please comment

38. Do you believe that your library effectively meets its current teaching objectives?

Yes

No

Don't know

39. How do you assess student learning in your instruction program? (Check all that apply)

We do no assessments

Through student self-assessment

By comparing pre- and post-instruction test results

Through formative assessment during in-class sessions

Through quizzes/tests

Through information literacy assignments

Through questions and activities integrated into course assignments and exams

Through citation analysis of course assignments

Faculty feedback

Other, please specify

40. How do you evaluate the effectiveness of your library's instruction program? (Check all that apply)

We do no evaluations

Self-evaluation by individual instructors/librarians

Informally from feedback received from faculty

Informally from feedback received from students

By reviewing student learning assessment results

With feedback questionnaires to faculty

With feedback questionnaires to students

Through citation analysis of course assignments

Other, please specify

41. Is instruction in your library provided with distinct funding in the library budget?

No

Don't know

Yes – what proportion of the budget is dedicated to instruction?

42. How much non-financial support (e.g., administrative support, recognition, encouragement) does your library administration provide for instructional activities?

Full support

Moderate support

Very little support

No support

43. How do you publicize instructional programs in your library? (Check all that apply)

Personal faculty contact

Notices or letters to faculty

Notices in campus newspaper

Notices on web

Posters

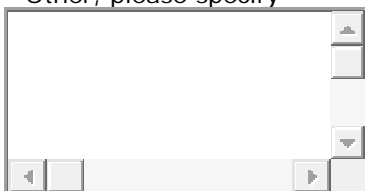

Email discussion lists

Departmental meetings

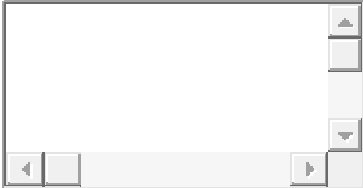

Social media

We do not purposefully promote instruction in our library

Other, please specify

44. What are some of the challenges you face as you try to provide instruction?

An empty rectangular text input box with a light gray border. On the right side, there are three small square buttons stacked vertically, each containing a small upward-pointing arrow. On the bottom left, there are two small square buttons, each containing a left-pointing arrow. On the bottom right, there are two small square buttons, each containing a right-pointing arrow.

45. Do you have any other comments about instruction at your campus?

An empty rectangular text input box with a light gray border. On the right side, there are three small square buttons stacked vertically, each containing a small upward-pointing arrow. On the bottom left, there are two small square buttons, each containing a left-pointing arrow. On the bottom right, there are two small square buttons, each containing a right-pointing arrow.

This concludes the survey. Thank you for your participation.
